# HYDROSILENCE, silence in the tub

The first and only super silent whirlpool, a complete and profound experience to enjoy anytime you like, even at night.

The sound emissions in the tub are reduced by 70%: all you can hear is the pleasant flow of water.

Studies and certifications show that Hydrosilence takes the whirlpool to its very essence by releasing the sound of water from artificial noise.

In addition, maximum massaging efficiency and energy savings are guaranteed.

Only Teuco offers such authentic well-being, since Hydrosilence is only by Teuco.

## **SILENCE GETS IN THE TUB: MULTI-SENSORIAL PLEASURE**

Hydrosilence is the first super silent whirlpool, capable of bringing multi-sensorial wellness to the bathtub: finally you can simply listen to the sound of water in all its purity while your other senses enjoy an extremely captivating experience.

With Hydrosilence you relax without disturbing your neighbours. Since there is no noise, you can now fully enjoy the ideal time for a whirlpool bath: the evening.

Hydrosilence is unique and it is only available in Teuco tubs.

## - 70% NOISE IN THE TUB, + ACOUSTIC QUALITY

Teuco didn't decide to cut down the noise of the whirlpool system. They decided to do away with it completely.

For this reason, the company focused directly on the sources which generate the most annoying noises, and managed to cut down noise in the tub by 70%.

The silence does not impair the performance of the whirlpool in any way, on the contrary, it is even more effective thanks to the guaranteed excellent water/air mixture.

Hydrosilence was tested at the Fraunhofer Institut, an independent German research institute. The Fraunhofer Institut certified that Hydrosilence meets the exacting standards of German regulations (DIN 17025), recognised internationally, which sets specific limits on the amount of noise that may be transmitted to rooms adjacent to those where the product is used.

In addition to the quantity of noise, Teuco has also improved the **perceived quality** of sound (acoustic comfort) by removing the noise components found most irritating to the human ear: the low frequency resonance emitted by the motor and the hissing of the air suction system.

Hydrosilence cuts down the amount of noise transmitted to adjoining rooms, and increases your acoustic comfort.

## NOISELESS TECHNOLOGY

Hydrosilence is the result of a combination of several technological solutions used by Teuco to work directly on the sources of noise:

- \_ A sophisticated electronic control system makes it possible to exploit fully the performance of the new motor, which is more balanced and does not vibrate at low frequencies.
- \_ A new way of adjusting the intensity of the massage: my idro, an innovative function that acts directly on the motor revolutions and therefore on the massaging flow, guaranteeing the best mixture of air and water at all times, whatever the chosen massage level. Owing to this improved motor performance, Hydrosilence makes it possible to save on energy, by lowering consumption by up to 50%.
- \_ A special patent, an absolute first in the industry, does away with the noise of the suction valve.
- \_ Several levels of anti-vibration solutions eliminate the vibrations transmitted from the tub to the floor and walls.

The result of this new technology is a system featuring performance levels unique in the world and which return the natural aspect of a whirlpool experience.

## HYDROSONIC, beauty comes with ultrasound

Only a Teuco bathtub can be equipped with an ultrasound whirlpool that enables you to benefit from the same treatments you would have in a beauty spa.

Hydrosonic is much more than a normal whirlpool. Its beneficial action reaches far beyond those of standard whirlpools: it reaches single cells thanks to a massage that is

- Deep: 2/3 cm under the epidermis
- Intense: 3 million times per second
- Distributed evenly over your body thanks to the exclusive ultrasound jets system (a Teuco patent).

The effects of a spa treatment available in the full comfort of your home in total relaxation.

### **THE WHIRLPOOL WITH ULTRASOUND, THE ONLY ONE IN THE WORLD**

Every Teuco Hydrosonic tub holds a secret: it is the only tub in the world to emit ultrasound massaging beams that, when combined with the standard whirlpool massage, ensure relaxation and boost your energy as never before.

The ultrasound improves the nutritional exchange between the tissues and the blood by working on lymphatic drainage, blood circulation and the vascularisation of tissues.

Achieve a toned body and reduce the discomfort and unsightly appearance of cellulite and muscle contraction, and recover your energy after a good work out. It's easier with Hydrosonic.

### **WHERE NO ONE ELSE CAN GO: IN DEPTH**

The ultrasound waves reach each individual cell, 2-3 cm under the epidermis, 3 million times per second. A deep micromassage with incomparable effects. When you choose Hydrosonic, you choose several products in one. Hydrosonic is a source of health and beauty which is highly customisable as it enables you to choose from 4 massage programmes: beauty, after sport, tone up and anti-stress. By regulating features such as the thermal effect, the mechanical effect of the ultrasound waves, the capacity and intensity of the whirlpool massage, you can achieve specific and differentiated wellness results.

### **WATER, AIR, ULTRASOUND: TECHNOLOGY AND SCIENTIFIC STUDIES**

A special patented jets combines the emission of a wide ultrasound beam with the air and water flows of the whirlpool. Mechanical waves similar to sound waves propagate, radically exploiting the propagation capacity provided by the water and generate an effect that envelops the whole body rather than single areas thanks to the jets characteristics and the distribution of the waves over the tub surface.

All phases of the Hydrosonic project were carried out with the help of a medical committee made up of doctors and researchers specialised in Radiology, Dermatology, Neuroradiology and Health Physics.

Tests on the distribution and characteristics of ultrasound waves were carried out at the Force Institute of Copenhagen.
